

Appropriate screening methodology using single or a combination of approved methods following the cessation of REST.

Freightnet Handling's ethos is to ensure that safety of the travelling public is maintained at all times. Our staff are trained to identify and apply the correct screening methods to your freight to ensure it reaches its destination safely – and on time. We do this by applying the most up to date CAA approved screening methodologies, identifying the most appropriate method, either singularly or in combination to your freight to ensure it is safe to fly.

Freightnet operate the only 180x180 320kv DV X-Ray Machine in Europe. As this is the only x-ray machine currently available commercially which has this level of penetrative power and provides a dual view image for cargo up to 180cm wide and 180cm high we can confirm that we are able to offer an x-ray screening service significantly in advance of our competitors.

Key advantages are:

- **Greater confidence that shipments do not contain prohibited articles.**
- **Faster screening times.**
- **Fewer items rejected for being too dense.**

We can also offer Explosive Trace Detection either at our X2 facility – or at your regulated site.

We also offer screening by hand search, and if cargo needs to be packed or repacked for flight, our in house packers at X2; Neal Brothers Heathrow, are able to repack to the highest standard in the Heathrow area.

These screening methodologies used separately, or in combination ensure that your freight meets all the requirements of the CAA and the TSA – every time.
